

Project Objectives

University Policy Platform · Rewritten 31 July 2026 following supervisor feedback (SMART approach; role-based access moved to system design)

Main Objective

To develop and empirically evaluate a centralized web platform that hosts university policy documents and answers natural-language policy questions through retrieval-augmented generation (RAG).

Specific Objectives

#	Objective (SMART)	Timeline	Measure of success
1	To develop, by the end of Week 1, a web platform that centralizes university policy documents into a single hosted repository with PDF upload and storage.	Week 1	Platform hosts an initial corpus of ≥ 30 policy documents.
2	To implement, by the end of Week 2, an administration module for maintaining the repository: adding new policies, replacing outdated versions, and archiving retired ones.	Week 2	An administrator completes each maintenance action end to end.
3	To integrate, by the end of Week 4, a RAG pipeline (vector embeddings + LLM, Chroma) that answers natural-language questions with citations to source policies.	Weeks 3–4	$\geq 80\%$ top-k retrieval precision on a benchmark set of 50 test questions.
4	To deploy the system, by the end of Week 6, to a test group of ≥ 20 users for a two-week period, logging every query (text, timestamp, retrieved documents, confidence score, unanswered queries) to the QueryLog table.	Weeks 5–6	Dataset of ≥ 200 logged queries from real users.
5	To analyze the collected data, by the end of Week 9, benchmarking retrieval accuracy and identifying the most frequently queried and most ambiguous policies.	Weeks 7–9	Evaluation report with accuracy metrics and policy-ambiguity charts for university leadership.

Total duration: 9 weeks.
